Theoretic example, Thrust by Gyroscopic Lift with a Particle Accelerator:

50 milligrams of ionized particles, continuously traveling along a circular path at 60% velocity of light should provide 2.54. x 10² Newtons of upward thrust.

m measured in Kg

$$\begin{split} F_{particles} &= m_{particles} \, x \, a_z \ , \\ F &= m_{x} \, \left[v^2 / (r_{planet} + alt) + g \right] \\ F &= 50 \, x 10^{-6} \, x \, \left[(2.998 \, x \, 10^8 \, x \, .60)^2 / \, (6.371 \, x \, 10^6) \, -9.821 \right] = 253,938 \, N \end{split}$$

Figure 8

Theoretic example, Vertical Acceleration of Ship with Particle Accelerators

 $F_{particles} + F_{gravity} = F_{ship}$, $F_{particles} + F_{gravity} = m_{ship} \; x \; \; a_{ship}$

 $F_{particles} + (m_{ship} \times g) = m_{ship} \times a_{ship}$

 $[F_{particles} + (m_{ship} x g)] / m_{ship} = a_{ship}$ $[(2 x 2.54 x 10^5) + (40 x 10^3 x -9.821)] / (40 x 10^3) = 2.879 m/s^2$

 $2.879 \text{ m/s}^2 / 9.821 \text{ m/s}^2 = .2931 \text{ g/s}$
